ACCESSIBLE

for everyone

Digital Accessibility

Everyone experiences the world **differently**.
Some people **see** differently.
Some **hear** differently.
Some **move** or **learn** in different ways.

Accessibility means designing websites and digital tools so everyone can use them.
We follow four important principles:

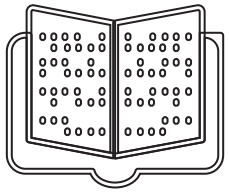
- **Perceivable**
- **Operable**
- **Understandable**
- **Robust**

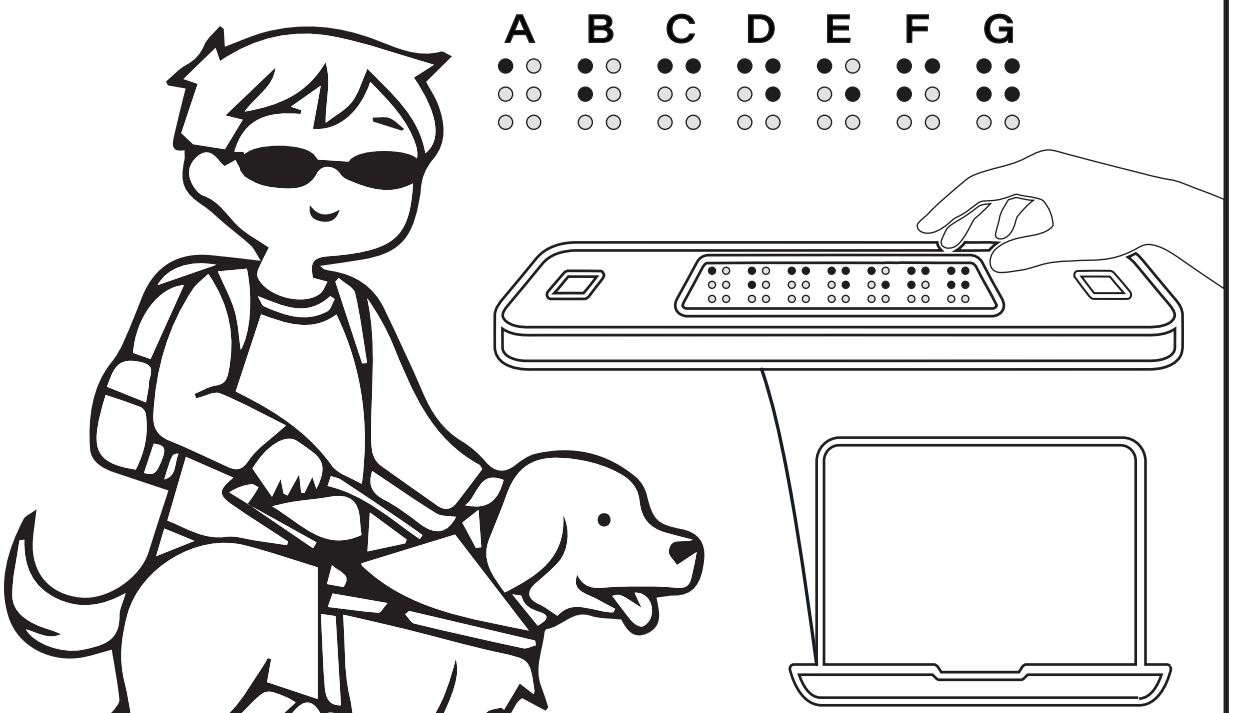
European Parliament

Perceivable

Digital Accessibility

Information must be available to the senses. People need **to see it, hear it, or feel it** in a way that works for them.

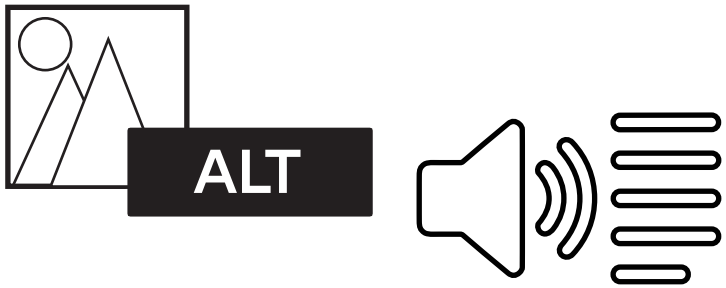




Simon is blind.
A guide dog helps him move safely through his neighbourhood and find his way.

Simon reads using Braille.

His **refreshable Braille display** allows him to read stories, blogs, and books online **by touch**.



When websites are **built accessibly,** the content works with his screen reader and Braille display.

That means Simon can explore and learn **independently**.

Some people **see** differently.
Some **hear** differently.
Some **move** or **learn** in different ways.

Accessibility means designing websites and digital tools so everyone can use them.
We follow four important principles:

- **Perceivable**
- **Operable**
- **Understandable**
- **Robust**

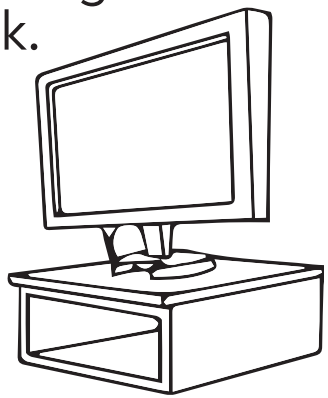
European Parliament

Operable

Digital Accessibility

Everyone must be able to **navigate** and control the interface.

Ola uses a powered wheelchair. She moves and steers it using a small joystick.

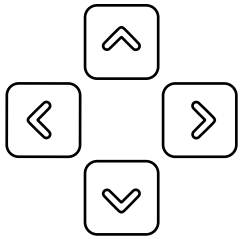


Using her computer works in a similar way.

Ola uses assistive technology to control it. A special joystick and switches help her move through menus, links, and buttons.

She can also use **voice commands** to open apps, scroll pages and select things.

Websites that are built so everything can be reached and activated, **allow Ola to use the internet in her own way.**



TAB

That means she can move, choose, and explore online **independently.**

- **Perceivable**
- **Operable**
- **Understandable**
- **Robust**

European Parliament

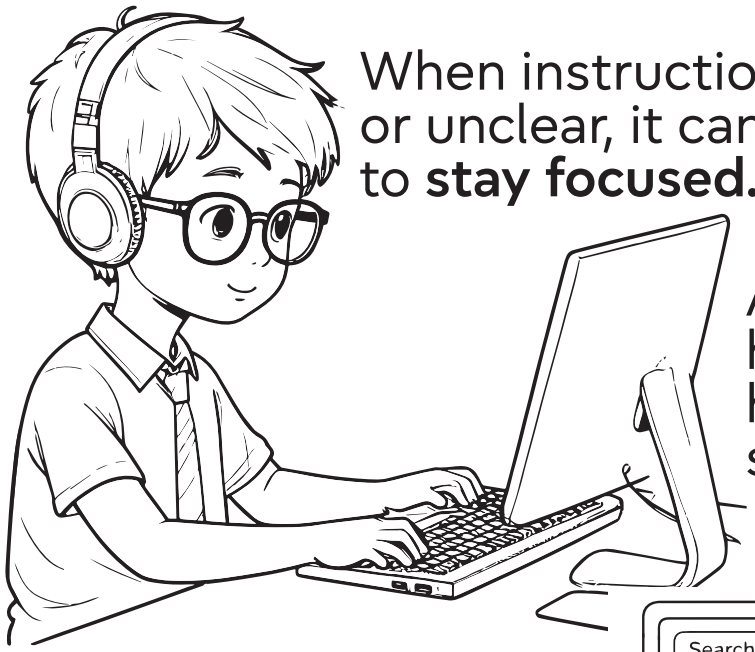
Understandable

Digital Accessibility

Content and instructions must be **clear** and **predictable**.

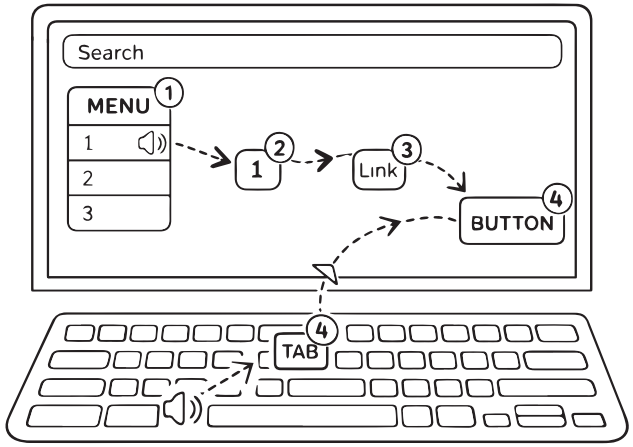
Sam has ADHD.

When instructions are long or unclear, it can be **hard** for him to **stay focused.**



At **school** he often completes homework and small tests **online**.

Some websites **explain** tasks **step by step**. They show **clear** instructions and **simple** messages.



If something is missing, the page clearly explains what needs to be added before sending the task.

(DD/MM/YYYY)

Because the instructions are **clear** and **predictable**, Sam feels less stressed and knows what to do next.

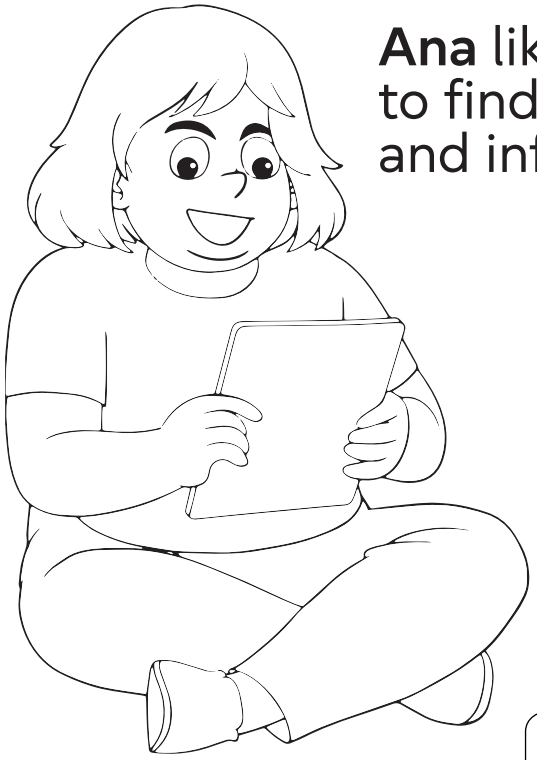
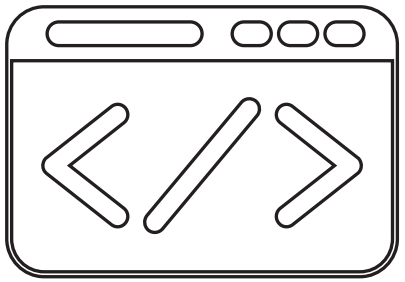
Robust

Digital Accessibility

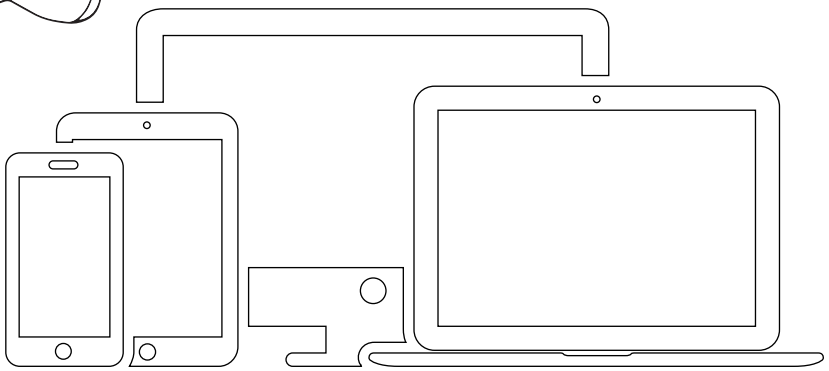
Content must work with **different devices** and assistive technologies, **now and in the future.**



Ana likes exploring websites to find new stories and information.

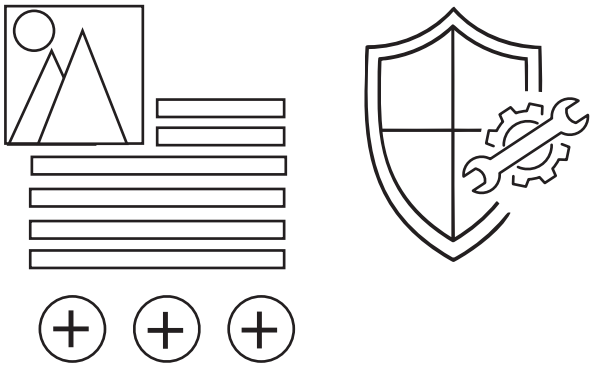


Websites are built using special digital rules called **web standards.**



These rules help **different technologies** understand the page.

When technology interprets the page correctly, the **content remains available** even as tools and software **change over time.**



That means Ana can keep **accessing** the same information with **every technology she uses.**
